

1 We could consider generalizing this model to provide multiple layers of feature discovery, e.g. for image recognition $\Rightarrow (x) \rightarrow (y) \rightarrow (y) \rightarrow (y)$ and now original mid-level high-level you can features feature 5 features predict (pixels) (lines, curves) (complex shapes) a zebra veBUS a horse!

this is called an M-layer feedforward neural network.

Let's drop all those (n) superscripts for convenience (we'll bring them back when needed to avoid confusion). This gives us:

Just in case we've forgother which of these are vectors and which are matrices, here it is explicitly:

$$\begin{bmatrix} \dot{\omega}_{11} & \cdots & \dot{\omega}_{1H} \\ \dot{\omega}_{D1} & \cdots & \dot{\omega}_{DH} \end{bmatrix} \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{1H} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \end{bmatrix} \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \end{bmatrix} \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \end{bmatrix} \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \end{bmatrix} \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \end{bmatrix} \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \end{bmatrix} \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \end{bmatrix} \qquad \qquad \begin{bmatrix} \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \ddot{\omega}_{11} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{HH} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H1} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H1} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H1} \\ \vdots & \ddots & \ddots & \ddots \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H1} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H2} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H1} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H2} \\ \ddot{\omega}_{H1} & \cdots & \ddot{\omega}_{H2} \\ \ddot{\omega}_{H2} & \cdots & \ddot{\omega}_{H2$$

We assume each "feature discovery" layer discovers H features.

To train this model using gradient descent, we need to be able to compute Il for each weight ϖ_{ij} .

Before doing this in its fill generality, let's see how we can compute these derivatives for a 3-layer network where H=2 and D=3.

5) As we did before for the feature discovery network, let's break down the endogenous variables into scalars to make it easier to apply the Chain Rule of Partial Derivatives;

$$\begin{bmatrix} \dot{\omega}_{11} \\ \dot{\omega}_{21} \\ \dot{\omega}_{31} \end{bmatrix} = \begin{bmatrix} \ddot{\omega}_{11} \\ \ddot{\omega}_{21} \\ \ddot{\omega}_{21} \end{bmatrix}$$

$$\begin{bmatrix} \dot{\alpha}_{11} \\ \dot{\alpha}_{22} \\ \dot{\alpha}_{32} \end{bmatrix} \rightarrow \begin{bmatrix} \dot{\alpha}_{11} \\ \dot{\alpha}_{22} \\ \dot{\omega}_{12} \\ \dot{\omega}_{22} \end{bmatrix}$$

$$\begin{bmatrix} \dot{\omega}_{12} \\ \dot{\omega}_{12} \\ \dot{\omega}_{22} \end{bmatrix}$$

$$\begin{bmatrix} \ddot{\omega}_{12} \\ \ddot{\omega}_{22} \\ \dot{\omega}_{22} \end{bmatrix}$$

$$\begin{bmatrix} \ddot{\omega}_{12} \\ \ddot{\omega}_{22} \\ \ddot{\omega}_{22} \end{bmatrix}$$

6 Our goal is to compute (for all relevant i, j): $\frac{\partial l}{\partial \dot{w}_{ij}}$ and $\frac{\partial l}{\partial \ddot{w}_{ij}}$ and $\frac{\partial l}{\partial \ddot{w}_{ij}}$

First, we can observe that it separates I from all wij, so:

$$\frac{\partial \mathcal{L}}{\partial \mathcal{Q}_{ij}} = \frac{\partial \mathcal{L}}{\partial \tilde{\pi}} \cdot \frac{\partial \tilde{\pi}}{\partial \mathcal{Q}_{ij}}$$

This is the just the standard derivative of the loss function.

The So the challenge is to compute
$$\frac{\partial \tilde{n}}{\partial \tilde{w}_{ij}}$$
 for any layer m.

It's shaightforward for
$$m=3$$
:
$$\frac{\partial \ddot{u}}{\partial \ddot{w}_{ij}} = \frac{\partial}{\partial \ddot{w}_{ij}} \left[\begin{array}{c} \ddot{x}_1 \\ \ddot{x}_2 \end{array} \right] \begin{bmatrix} \ddot{w}_1 \\ \ddot{w}_2 \end{bmatrix} = \ddot{x}_2$$

$$\frac{\partial \ddot{\pi}}{\partial \ddot{\omega}_{ij}} = \frac{\partial \ddot{\pi}}{\partial \ddot{\pi}_{ij}} \cdot \frac{\partial \ddot{\pi}_{ij}}{\partial \ddot{\omega}_{ij}}$$

$$= \frac{\partial \ddot{\pi}}{\partial \ddot{n}_{s}} \cdot \dot{x}_{s}$$

$$\frac{\partial \tilde{\pi}}{\partial \tilde{\omega}_{ij}} = \frac{\partial \tilde{\pi}}{\partial \tilde{\pi}_{ij}} \frac{\partial \tilde{\pi}_{ij}}{\partial \tilde{\omega}_{ij}}$$

$$\left[\frac{\partial \pi}{\partial \dot{w}_{ij}} = x_{i}\right]$$

10 In summary:
$$\frac{\partial \ddot{\pi}}{\partial \ddot{w}_{ij}} = \ddot{x}_{i}$$

for the general case:

so how do we ? compute this term!

(1) Consider Dir for our 3-layer network.

$$\frac{\partial \ddot{n}}{\partial \dot{n}} = \frac{\partial \ddot{x}}{\partial \dot{n}} \frac{\partial \dot{x}}{\partial \dot{x}}$$

$$= \left(\frac{2}{\sum_{h=1}^{2}} \frac{\partial \ddot{\eta}_{h}}{\partial \ddot{\eta}_{h}} \frac{\partial \ddot{\eta}_{h}}{\partial \dot{x}_{h}}\right) \frac{\partial \dot{x}_{h}}{\partial \dot{\eta}_{h}}$$

$$= \frac{\partial \dot{x}}{\partial \dot{n}_{j}} \sum_{h=1}^{2} \frac{\partial \dot{n}_{h}}{\partial \dot{x}_{j}} \frac{\partial \ddot{n}}{\partial \dot{n}_{h}}$$

$$= \alpha'(\dot{\pi}_{1}) \sum_{h=1}^{2} \ddot{\omega}_{h_{1}} \frac{\partial \ddot{\pi}_{h}}{\partial \ddot{\pi}_{h}}$$

but this can be computed recursively in the same way!

$$\frac{\partial \ddot{\pi}}{\partial \dot{\pi}_{j}} = \alpha'(\dot{\pi}_{j}) \sum_{h=1}^{2} \ddot{\omega}_{h}, \frac{\partial \ddot{\pi}}{\partial \ddot{\pi}_{h}}$$

and for the general case:

BACKPROPAGATION:

(a) for m in
$$\{M-1, ..., 1\}$$
 and j in $\{1, ..., H\}$:

compute $\frac{2M}{2M} = q'(M)$
 $\frac{2}{2M}$
 $\frac{2}{2M}$
 $\frac{2}{2M}$
 $\frac{2}{2M}$
 $\frac{2}{2M}$
 $\frac{2}{2M}$
 $\frac{2}{2M}$
 $\frac{2}{2M}$

$$\frac{\partial \mathcal{B}^{(1)}}{\partial \mathcal{B}} = \frac{\partial \mathcal{B}}{\partial \mathcal{B}} \cdot \frac{x^{(1)}}{\partial \mathcal{B}} \cdot \frac{\partial \mathcal{B}^{(2)}}{\partial \mathcal{B}}$$

Computed during (a) just a simple derivative of the loss function

14) Because we compute the partial derivatives 200 200 starting from the Call 1

starting from the final layer M and moving backwards, this algorithm is known as backpropagation.
