D By now, we've seen several instances of the regression model:

3) For each of these, we've figured out how to compute a point estimate of the weight vector by minimizing a loss function:

compute
$$\hat{w} = \operatorname{argmax} P(w) \prod_{n=1}^{N} P(y^{(n)} | w, x^{(n)})$$

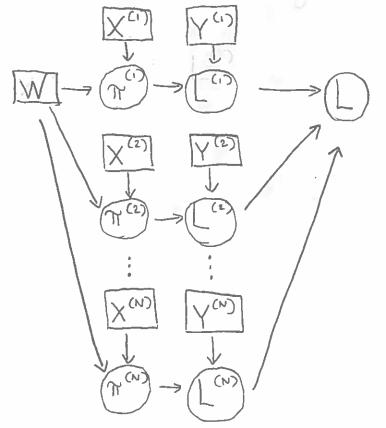

$$= \operatorname{argmin} L(w)$$

where: $L(w) = \sum_{n=1}^{N} (y^{(n)} - w^{T} \times w^{n})^{2}$ $L(w) = \sum_{n=1}^{N} (y^{(n)} - w^{T} \times w^{n})^{2} + \frac{\sigma^{2}}{r^{2}} w^{T} w \quad \text{for ridge regression}$ $L(w) = \sum_{n=1}^{N} (y^{(n)} - w^{T} \times w^{n})^{2} + \frac{\sigma^{2}}{r^{2}} w^{T} w \quad \text{for ridge regression}$ $L(w) = \sum_{n=1}^{N} (1 - y^{(n)}) w^{T} \times w^{n} + \log(1 + e^{-w^{T} \times w^{n}}) \quad \text{for logistic regression}$

3) Notice that all of these loss functions can be expressed:
$$L(w) = \sum_{n=1}^{\infty} L^{(n)}(w)$$

$$L^{(n)}(w) = (y^{(n)} - w^{T}x^{(n)})^{2}$$
 for ordinary linear regression
$$L^{(n)}(w) = (1-y^{(n)})w^{T}x^{(n)} + \log(1+e^{-w^{T}x^{(n)}})$$
 for logistic regression

4) We can depict point estimation as a causal diagram:

where:
$$\pi^{(n)} \leftarrow w^{T} \times^{(n)}$$

$$L \leftarrow \sum_{n=1}^{N} L^{(n)}$$

(5) The variables L(1), ..., L(N) separate W from L in the causal diagram, so we can apply the Chain Rule of Partial Derivatives to compute 2L:

$$\frac{3m}{3\Gamma} = \sum_{N} \frac{3\Gamma_{(N)}}{3\Gamma} \cdot \frac{3m}{3\Gamma_{(N)}}$$

$$= \sum_{n=1}^{N} \frac{\partial \sum_{n=1}^{N} (n)}{\partial L^{(n)}} \cdot \frac{\partial L^{(n)}}{\partial w}$$

6 So the main computational task is to compute <u>DL</u>(n)
for any arbitrary n:

$$\begin{array}{c} \begin{array}{c} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c}$$

of Partial Derivatives

We can confinue to use the Chain Rule to do this, since or " separates W from L".

$$\frac{3m}{3\Gamma_{(\omega)}} = \frac{3\mu_{(\omega)}}{3\Gamma_{(\omega)}} \cdot \frac{3m}{3\mu_{(\omega)}}$$

Fimplifying, we get:
$$\frac{\partial}{\partial w} = \left(\frac{\partial}{\partial \eta^{(n)}}\right) \cdot \left(\frac{\partial}{\partial w}\right) \cdot \left(\frac{$$

(3) Finally, we need to compute $\frac{2}{2\pi^{(n)}}$ L⁽ⁿ⁾, which is the only thing that depends on which version of regression where using (each has its own loss function). For ordinary linear regression: $\frac{2}{2\pi^{(n)}} = \frac{2}{2\pi^{(n)}} \left(y^{(n)} - \pi^{(n)}\right)^2$ $= 2\left(y^{(n)} - \pi^{(n)}\right) \cdot (-1)$ $= -2\left(y^{(n)} - \pi^{(n)}\right)$

9 Putting it all together:

$$\frac{\partial L}{\partial w} = \sum_{n=1}^{N} \frac{\partial L^{(n)}}{\partial w}$$

$$=\sum_{N=1}^{N}\frac{\partial u_{(N)}}{\partial u_{(N)}}\sum_{(N)}\frac{\partial w}{\partial u_{(N)}}$$

$$= \sum_{n=1}^{N} -2(y^{(n)}-\eta^{(n)}) \times {}^{(n)}$$

$$= -2 \sum_{n=1}^{N} y^{(n)} x^{(n)} + w^{T} x^{(n)} x^{(n)}$$

$$=-2\left(X^{T}y+X^{T}Xw\right)$$

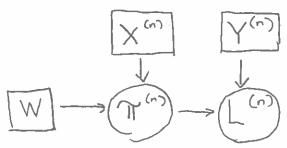

$$=-2X^{T}y+2X^{T}Xw$$

[b/c y(n) and w x

dot product commutes

[replacing sum w]
matrix multiplication]

10) This technique of computing $\frac{\partial L}{\partial w}$ by breaking it down repeatedly into simpler derivatives using the Chain Rule is a simple instance of a technique called backpropagation. The subdiagram

is a simple instance of a neural network.
